Hello everyone,

Build an interactive 2D digital car in p5.js that changes color when a user clicks on different on-screen color buttons. You will practice using coordinate geometry, layout structure, and tracking state variables.

1. Variables & Canvas Setup

• Create variables for the car's position (carX, carY) and its dimensions (w, h).
• Create a state tracker variable called carColor (e.g., 1 for Red, 2 for Green, 3 for Blue).
• Set up button position coordinates using separate horizontal variables: redX, greenX, and blueX.
• Create a 400x400 pixel viewport canvas inside setup().

3. (changeColor)

• Code a conditional logic rule check (if / else if) linked to your carColor variable.
• When a specific number is active, swap the fill() tool color to match the choice.

4. (drawCar)

Assemble your vehicle layer-by-layer using relative math based on your global variables:
• The Cabin: Position a small rectangle sitting cleanly on top of the main body chassis.
rect(carX, carY - h+h/4 , w/2, h, 10);
• The Windows: Draw two smaller light blue rectangles inside the cabin block.
• The Main Body: Render a larger rounded rectangle centered right below the cabin roof.
• The Wheels: Draw two dark outer circles for tires, and two smaller light gray inner circles for the metallic hubcaps.(ellipse(carX - w/3, carY + h/2, 40, 40); ellipse(carX + w/3, carY + h/2, 40, 40);

Good luck!
