Unit 1 Assessment — What to Expect

Read this the night before. It takes five minutes.

When and how long

The assessment is one class period. **40 minutes total.**

You will not need anything you don't already have.

How the period runs

Minutes	What's happening
0–2	Read the brief. Ask me any questions.
2–5	Answer the four setup questions as comments at the top of your sketch.
5–30	Build your sketch.
30–35	Save, share, submit the link.
35–40	Check your own link works. Wrap up.

You'll know the whole shape of the period before you start. No surprises.

What you're building

A sketch that does three things:

It moves. At least one variable changes in `draw()`, and at least three shapes follow it as offsets so they move together.

It reports. `text()` on the canvas showing a value that changes as the program runs — and that means something to whoever is watching.

It responds. A `keyPressed()` or `mousePressed()` that changes something visible when you use it.

What the thing is, is up to you. A lift going up a shaft. A plane on approach. A traffic light. A loading bar. A rover crossing a crater. Anything you can draw with the shapes you already know.

What to write — as comments

Two short comments in your code, three or four sentences each.

At the top of the file:

```
// WHAT THIS IS
// A description of what your sketch does and what someone watching
// would understand. Three or four sentences.
```
